## **FUTA EXPANDS ROAD NETWORK**

The drive to expand critical infrastructure and improve service delivery at the Federal University of Technology, Akure has become an established norm. One of the major projects that underscores this drive is the 2.3 kilometer road currently under construction and designed to cut across the new academic core areas to the Oba Kekere axis of the Campus. The road which takes its bearing from the oduduwa road around the mini campus area of the University through to the obanla axis would eventually link the School of Earth and Mineral Sciences, the International Office and the Security Unit among others to ease traffic flow on the main road. The project, being executed with internally generated revenue, is expected to be completed by mid-year. The expansion in critical infrastructure according to the Vice Chancellor, Professor Adebisi Daramola, is to keep pace with the unique selling point of academic excellence on the part of both staff and students who have over the years displayed mastery in research, innovation and technological advancement
