ABSTRACT

This project entails the design and implementation of a mobile application for disseminating information thereby promoting interaction among Nigerian farmers.

Traditionally, farmers get information via word of mouth from family and friends and this has led to stagnation in agricultural development as many farmers are not exposed to the latest developments in agriculture.

Due to the advancements in ICT, there are better ways of passing information to large number of farmers instantly. The system I am implementing utilizes this technology. Farmers with access to internet or via sms will be able to get notifications of vital agricultural information.
